## Midterm 1 Review

**Exercise 1.** We can represent a counter-clockwise rotation by an angle  $\theta$  about an axis  $\hat{r}$  by the unitary operator

$$U(\theta) = e^{-i\theta \hat{r} \cdot \mathbf{S}/\hbar}.$$

where S is the angular momentum operator. For particles of spin 1/2,  $S = \hbar \sigma / 2$ .

a) Show that  $(\hat{r} \cdot \sigma)^2 = 1$ , the identity operator. *Hint*: Using  $[\sigma_i, \sigma_j] = 2i\varepsilon_{ijk}\sigma_k$  and  $\{\sigma_i, \sigma_j\} = 2\delta_{ij}1$ , show first that

$$\sigma_i \sigma_j = \mathbb{1}\delta_{ij} + i\varepsilon_{ijk}\sigma_k.$$

b) Show that

$$U(\theta) = 1 \cos(\theta/2) - i\hat{r} \cdot \boldsymbol{\sigma} \sin(\theta/2).$$

- c) Determine the spin operator  $\sigma_{\theta}$  which points in the direction described by  $(\theta, \varphi)$  with  $\varphi = 0$ . *Hint*: Do this by rotating  $\sigma_z$  by an angle  $\theta$  about the *y*-axis.
- d) Redo problem 4.59 from Griffiths: If two electrons are in the spin singlet state,  $S_z^{(1)}$  is the component of spin angular momentum of particle 1 along the *z*-axis, and  $S_{\theta}^{(2)}$  is the spin angular momentum of particle 2 along the  $\hat{r} = (\theta, 0)$  axis, show that

$$\left\langle S_z^{(1)} S_\theta^{(2)} \right\rangle = -\frac{\hbar^2}{4} \cos \theta.$$

**Exercise 2.** *Griffiths 5.9.* Consider two non-interacting particles in an infinite square well of width *a* such that the single particle wavefunction is

$$\psi_n(x) = \sqrt{\frac{2}{a}} \sin(n\pi x/a)$$

with energy  $E_n = n^2 K$ . Construct the ground state and first excited state of the two-particle system if the particles are a) spin-1/2 and b) spin-1. Determine the energy and degeneracies of these states.

## Exercise 3. Helium.

a) Consider a singly-ionized helium ion. How much more energy does it take to ionize its bound electron compared to hydrogen?

- b) Still with He<sup>+</sup>. What is the wavelength of the emitted photon during the electron transition from  $n = 2 \rightarrow 1$ ?
- c) Now, consider the usual helium-4. Which ground state has higher energy, parahelium (spin singlet) or orthohelium (spin triplet)? Why? *Griffiths 5.14.* How would this change if the two electrons are identical bosons?
- d) Griffiths 5.22. Helium-3 is a fermion with spin-1/2 (as compared to helium-4, which is a boson. Why?). At low temperatures, helium-3 can be treated as a Fermi gas. If its mass density is 82 kg/m<sup>3</sup>, determine its Fermi temperature.

Exercise 4. Consider a transformation on a physical system represented by a unitary operator U.

- a) How do kets transform under U? What about operators?
- b) If the hamiltonian H commutes with U, what does that imply about H being invariant under the transformation U? What does this imply about a non-degenerate eigenstate of H?
- c) Derive parity selection rules for hydrogen with respect to momentum and angular momentum matrix elements. I.e. determine when

$$\left\langle n'l'm'|\mathbf{p}|nlm\right\rangle = 0$$

and

$$\left\langle n'l'm'|\mathbf{L}|nlm\right\rangle = 0.$$

**Exercise 5. Dilations.** Do Exercise 2 on the Week 5 Worksheet: Another symmetry is called **dilation** symmetry. Dilations are given by the transformation  $\mathbf{x} \to \mathbf{x}' = e^c \mathbf{x}$ , where  $c \in \mathbb{R}$ . Call its generator D, so that  $e^{-icD}$  is the corresponding unitary operator.

**Remark.** In conformal field theory, the convention is to absorb the factor of *i* into *D*, so that  $e^{-cD}$  is the dilation operator.

a) Show that the *infinitesimal* transformation

$$e^{i\mathbf{a}\cdot\mathbf{p}}e^{icD}e^{-i\mathbf{a}\cdot\mathbf{p}}e^{-icD}$$

is given by  $1 + c\mathbf{a} \cdot [D, \mathbf{p}]$ .

*Hints*: You can reduce to the situation where all the vectors are 1-dimensional (why?). There's a slick way to solve this problem (use the Baker-Campbell-Hausdorff formula), but the brute force method does work.

b) Calculate  $[D, \mathbf{p}]$ .

*Hint*: What coordinate transformation does the above correspond to? In other words, if you write it in the form  $\mathbf{x} \to \mathbf{x}'$ , what is  $\mathbf{x}'$ ?
